

STRUCTURE

Information architecture

Will be a simple structure of the page

Interaction Design:

Landing page is the first contact with the user, they can enter the website without any problem as Sign-up/Log-in is still not in use. Once the user press button, it is moved to Home page from here user can access links **Home**, **Add Recipe**, **Shop** and **Statistic**. Navigation bar includes as well link back to Landing page which is separate from other links.

On mobile and tablet devices the navigation bar is at the top of the left as a hamburger icon. Once it is pressed the navigation links will come from the left side as a dropdown. Each link is displayed in block and when hovered over will highlight.

Home page has option to look for specific category. User can see tiled display using cards, which shows each recipe separate. Each recipe is displayed with image (if was added by author of recipe- option in Add Page) and short description- category name of the recipe, title of the recipe and amount of views. User have two different ways of choosing a recipe either by clicking on the title name which is highlighted by means of hyperlink or by just clicking on the image of the recipe (if available). Once pressed user is moved to another page which is view of individual recipe. User on this page has option to Edit recipe or Delete recipe. At the moment website is without login system and everyone is able to do this option, once login system will be in use it will be only allowed by the author of recipe. Delete option of the recipe has pop out message in case user change their mind.

The next link user sees is Add Recipe link. On that page user can enter all needed information regarding recipe and submit it. This is uploaded to NoSql database in the form of MongoDB where is stored. Once the user enters and successfully submitted it is then visible on Home page where it is then possible to view the recipe with all the content.

The next link on the website is Shop link. It is not open for the user as yet but makes them aware that feature option will be available. Once pressed button takes the user to Home page.

The last link on the website is Statistic link. At the moment data is not connected with the website. In the future there will be an option where the user will have access to data constantly updated with the view of things like allergies, calories, specific items and many more.
